

PSP Merchant Portal – Merchant-Facing Features

Product Requirements – Merchant Experience

1. Dashboard & Business Overview

The Dashboard provides merchants with a consolidated view of their payment activity, financial position, and key business performance indicators. It should allow merchants to quickly understand what is happening across their account and identify items that require attention. The information displayed should be based on the products and services enabled for the merchant.

- Total payment value and transaction volume
- Successful, pending, failed, reversed, and refunded transactions
- Payment success rate
- Recent transactions
- Upcoming and completed settlements
- Refund and dispute summary
- Fees and net payment value
- Performance trends over selected periods
- Important account alerts
- Actions requiring merchant attention

For wallet-enabled merchants, the dashboard should additionally display:

- Available wallet balance
- Pending funds
- Held or reserved funds, where applicable
- Recent wallet activity
- Recent transfers and disbursements

The dashboard should provide links to the underlying transactions, settlements, transfers, or other records represented by each summary.

2. Merchant Profile & Business Settings

The Merchant Profile provides a central location for merchants to view and manage the business information associated with their PSP account.

- Business name and registration information
- Business category and description
- Business contact information
- Business address and operating locations
- Tax and regulatory information, where applicable
- Directors and beneficial owners
- Settlement account details
- Supported currencies
- Uploaded business documents
- Account verification status

- Enabled products and payment methods
- Account status and applicable restrictions

Changes to sensitive information, such as settlement account details, should be subject to appropriate verification and approval controls.

3. Merchant Onboarding & Verification

The portal should provide a guided onboarding process that enables merchants to register their business, provide the required information, complete verification, and track their application before processing live payments. The PSP will integrate with Smile ID to support KYC and KYB verification during merchant onboarding. The integration will enable the verification of merchant identity and business information as part of the onboarding and due diligence process.

- Business registration and onboarding
- KYC/KYB information collection
- Integration with Smile ID for identity and business verification
- Director, owner, and beneficial-owner information collection
- Identity verification
- Business registration document submission and verification
- Ownership information
- Settlement bank account details and verification
- Supporting document upload
- Application progress tracking
- Verification status and results
- Requests for additional information
- Application resubmission
- Approval or rejection status
- Verification history

The merchant should always be able to understand their current onboarding and verification status, any outstanding requirements, and the actions required to complete the process. Where verification is performed through Smile ID, the portal should present the outcome to the merchant in clear business language without exposing unnecessary technical details from the underlying verification service.

4. Payment Methods

Merchants should be able to view the payment methods available for accepting customer payments and manage the methods enabled for their business where applicable.

- Cards
- Mobile Money
- Bank Transfer
- USSD
- QR payments
- Other locally supported payment methods

Key capabilities include viewing available and enabled payment methods, activation status, supported currencies, applicable transaction fees and limits, and payment-method-specific requirements. Merchants may request

activation of additional eligible payment methods. Availability may vary according to market, business type, account configuration, and enabled PSP services.

5. Payments & Transaction Management

Payments & Transaction Management provides merchants with a complete view of customer payments processed through the PSP. Merchants should be able to track each transaction from initiation through its final status and understand the amount received, applicable fees, and resulting net amount.

- View all transactions
- Search by transaction reference or customer information
- Filter by date, amount, status, payment method, and currency
- View transaction amount, processing fees, and net amount
- View payment method and customer information
- View transaction date and time
- View transaction status and timeline/history
- View related refunds or disputes
- View payment reference
- Export transaction records

Transaction statuses should clearly distinguish between Initiated, Pending, Successful, Failed, Reversed, Partially Refunded, and Refunded. Where relevant, the merchant should also be able to understand the funds availability status associated with a successful transaction, including whether funds are pending, available, held, allocated to a wallet, or scheduled for settlement.

6. Customer Management

Customer Management enables merchants to view customers who have transacted with their business and understand their associated payment activity.

- View customer profiles
- Customer name and contact information
- Search customers
- View customer payment history
- View total amount paid
- View number of transactions
- View successful and failed payments
- View refund history
- View disputes associated with customer transactions
- View last transaction date

Customer records should provide merchants with sufficient information to support payment enquiries and understand transaction history without exposing unnecessary sensitive payment information.

7. Refunds

Refunds enable merchants to return all or part of an eligible payment to a customer. Refunds should remain linked to the original transaction so that the merchant can clearly understand the relationship between the payment and the returned funds.

- Initiate a full or partial refund
- Select an eligible transaction
- Specify refund amount and reason
- View applicable refund fees
- View refund status, reference, and date
- View refund history
- View remaining refundable amount
- Receive confirmation of refund outcome

For wallet-enabled merchants, eligible refunds may be funded from the merchant's available wallet balance, subject to sufficient funds and applicable rules. The portal should clearly communicate when a refund cannot be processed and what action is required.

8. Disputes & Chargebacks

The Disputes & Chargebacks feature enables merchants to view, respond to, and track payment disputes raised against their transactions.

- View open disputes and dispute history
- View associated transaction, disputed amount, and reason
- View dispute status and response deadline
- Submit supporting evidence
- Add merchant response or comments
- Track dispute resolution
- View chargeback deductions
- Receive notifications for disputes requiring action

The portal should clearly identify disputes requiring immediate merchant action and communicate applicable deadlines.

9. Settlements

Settlements enable merchants to receive eligible funds collected through the PSP into their nominated and verified settlement account according to an agreed settlement schedule. For a standard collections-only merchant, collected funds are processed and the full eligible net amount is transferred to the merchant's verified bank account according to the applicable cycle, such as T+1, T+2, or weekly. The merchant does not need to maintain or manage a wallet for this process.

- View settlement schedule
- View next expected settlement
- View settlement amount, destination, status, and date
- View settlement reference and history
- View transactions included in a settlement
- View applicable fees
- View deductions and adjustments
- View reserves or holds affecting settlement
- Download settlement statements

Each settlement should provide a clear breakdown showing how the final settlement amount was calculated, allowing merchants to reconcile what they collected against what they ultimately received.

10. Wallet Services – Optional Merchant Capability

Wallet Services provide eligible merchants with an optional stored balance that gives them greater control over how available funds are retained and used within the PSP. Unlike standard settlement, where eligible funds are transferred to the merchant's nominated settlement account according to an agreed cycle, a wallet-enabled merchant can retain eligible funds within their wallet and use those funds for supported financial activities. Wallet Services should only be visible and accessible to merchants for whom the service has been enabled.

- View wallet balance
- View available balance
- View pending funds
- View held or reserved funds
- View wallet currency
- View funds available for transfer or disbursement
- View wallet activity
- View funds credited to and debited from the wallet
- View applicable wallet limits
- View wallet service fees where applicable

The merchant should always be able to distinguish between the total wallet balance and the amount currently available for use.

11. Wallet Activity & Balance History

Wallet Activity provides wallet-enabled merchants with a complete chronological record of transactions and movements that affect their wallet balance. Its primary purpose is to allow the merchant to understand why their wallet balance changed.

- View wallet credits and debits
- View payment credits
- View refunds
- View transfers and disbursements
- View fees
- View holds and releases
- View adjustments
- View settlements from the wallet, where applicable
- Search and filter wallet transactions
- View opening and closing balances
- View transaction reference
- Export wallet activity

Each wallet movement should clearly identify the source or destination of the funds, the amount, date, status, applicable fees, and resulting wallet balance.

12. Fund Management & Distribution

Fund Management enables wallet-enabled merchants to decide how available wallet funds should be retained, allocated, or distributed across supported uses. The wallet acts as the source of available funds, while Fund Management determines what the merchant chooses to do with those funds.

- Retain funds in the wallet
- Transfer funds to the merchant's own bank account
- Pay suppliers
- Pay approved beneficiaries
- Customer payouts
- Customer refunds
- Allocate funds to supported sub-accounts
- Other supported disbursements

Key capabilities include viewing funds available for distribution, selecting the intended use, specifying amounts, allocating funds to one or multiple supported destinations, viewing applicable fees before confirmation, reviewing and confirming distributions, and tracking distribution status and history. Where supported, merchants may configure predefined distribution rules using fixed amounts or percentages.

13. Beneficiaries & Payout Destinations

Beneficiary Management enables wallet-enabled merchants to maintain approved recipients and destinations to which funds can be transferred.

- Add and view beneficiaries
- Search beneficiaries
- Add bank account details
- Add mobile money details where supported
- View destination verification status
- Edit eligible beneficiary information
- Deactivate a beneficiary
- Set frequently used beneficiaries
- View previous payments to a beneficiary
- Select a beneficiary when initiating a transfer

Sensitive actions, such as creating or changing payout destinations, should require appropriate authentication and permissions. The system should validate payout destination details before allowing funds to be transferred.

14. Transfers & Disbursements

Transfers & Disbursements enable wallet-enabled merchants to send available wallet funds to approved recipients or destinations. This feature supports merchant-initiated movement of funds rather than the automatic settlement of collected payments.

- Initiate a transfer
- Select beneficiary or payout destination
- Specify transfer amount
- Select transfer method
- View applicable fees and total amount to be debited

- Review transfer details before confirmation
- Confirm transfer
- Track transfer status
- View transfer reference and history
- View failed or reversed transfers
- Retry eligible failed transfers
- View applicable transfer limits

Transfer statuses should be clearly communicated, for example Initiated → Processing → Successful, or Initiated → Processing → Failed/Reversed. The merchant's available wallet balance should reflect the appropriate change resulting from each transfer.

15. Payment Links

Payment Links enable merchants to accept customer payments without requiring a direct API or website integration.

- Create payment link
- Set fixed or customer-entered amount where supported
- Select currency
- Add payment description
- Capture customer information
- Set expiry date
- Generate shareable link
- Activate or deactivate link
- View payment status
- View transactions generated through the link
- View link performance

Payment Links should provide a simple collection option for merchants who do not have developer resources or who need to collect payments through messaging, email, or social platforms.

16. Invoicing

Invoicing enables merchants to create, send, and track payment requests for specific customers.

- Create invoice
- Generate invoice number
- Add customer information
- Add line items and descriptions
- Specify amount and currency
- Specify due date
- Generate associated payment link
- Send or share invoice
- View invoice status
- Track payment
- Send payment reminders
- View invoice history
- Download invoice

Invoice statuses should clearly distinguish between Draft, Sent, Due, Overdue, Paid, and Cancelled.

17. Fees & Pricing Visibility

Fees & Pricing Visibility enables merchants to understand the charges associated with using the PSP's products and services.

- View payment processing fees
- View payment-method-specific fees
- View settlement fees
- View refund fees where applicable
- View wallet service fees where applicable
- View transfer/disbursement fees
- View currency conversion fees where applicable
- View fee breakdown per transaction
- View total fees over a selected period
- View gross and net amounts

Where a merchant uses optional services such as Wallet Services or Transfers & Disbursements, applicable charges should be clearly communicated before the merchant performs a chargeable action.

18. Reports & Analytics

Reports & Analytics provide merchants with visibility into payment performance and financial activity.

- Total payment value and transaction volume
- Successful, failed, and pending transactions
- Payment success rate
- Average transaction value
- Payment-method performance
- Transaction trends
- Gross and net collections
- Fees
- Refunds
- Chargebacks
- Settlements and settlement deductions

For wallet-enabled merchants, reporting should additionally include wallet credits and debits, transfers and disbursements, wallet fees, and wallet balance movements. Reporting capabilities should include date-range selection, filters, period comparison, downloads, and export of transaction, settlement, wallet, and transfer data where applicable.

19. Notifications & Alerts

Notifications & Alerts provide merchants with timely information about important account, payment, and financial events.

- Successful and failed payments
- Refunds

- Disputes and chargebacks
- Upcoming or completed settlements
- Failed settlements
- Wallet credits and debits
- Transfers and disbursements
- Failed transfers
- Account verification updates
- Security events
- Actions requiring merchant attention

Merchants should be able to manage their notification preferences and supported delivery channels where applicable.

20. User Management & Access Control

User Management enables merchant administrators to provide team members with access to the portal while controlling the information and actions available to each user.

- Invite users
- Assign roles
- Manage permissions
- Activate and deactivate users
- View users
- Reset user access
- View user activity
- Manage roles

Example roles may include Administrator, Finance, Operations, Developer, and Viewer. Permissions should also control access to wallet functionality for wallet-enabled merchants. High-risk financial actions, such as transfers, beneficiary changes, or large refunds, may require additional permissions or approval.

21. Security & Account Protection

Security & Account Protection provides merchants with controls to protect access to their account and sensitive financial functionality.

- Multi-factor authentication
- Password management
- Account recovery
- Login history
- Active session management
- Device management
- Security notifications
- User access controls
- Additional verification for sensitive actions

Wallet-related actions such as beneficiary creation and fund transfers should support stronger verification where appropriate due to their ability to move merchant funds.

22. Developer & Integration Tools

Developer & Integration Tools provide merchants with the resources required to integrate their systems with the PSP.

- API credentials
- Test and live credentials
- API key management
- Credential rotation and revocation
- Integration settings
- Webhook configuration
- Callback configuration
- Integration status
- API activity
- Integration documentation
- Checkout configuration

The merchant experience should focus on managing the integration rather than exposing the PSP's underlying payment-processing infrastructure.

23. Sandbox & Test Environment

The Sandbox provides merchants and developers with a controlled environment in which they can test integrations and payment scenarios without moving real funds.

- Test merchant account
- Test credentials
- Test payment methods
- Test cards
- Test mobile money scenarios
- Successful payment simulation
- Failed payment simulation
- Pending payment simulation
- Refund testing
- Webhook/event testing
- Test transaction history

Where wallet and disbursement services are available, the sandbox should also support testing relevant wallet credits, transfers, and payout scenarios.

24. Audit & Activity History

Audit & Activity History provides merchants with a record of important actions performed within their account.

- User login
- User creation or deactivation
- Permission changes
- Refund initiation
- Beneficiary creation or modification
- Transfer initiation

- Settlement account changes
- Business profile changes
- API credential changes
- Payment configuration changes

Each record should identify the action performed, user who performed it, date and time, affected transaction, beneficiary, account or configuration, and the result or status.

25. Support & Help

Support & Help provides merchants with a central location to obtain assistance and track issues related to their PSP account.

- Help centre
- Frequently asked questions
- Raise support request
- Select issue category
- Link a relevant transaction, refund, settlement, or transfer
- View support request status
- View support history
- Contact support through available channels

Support requests should capture sufficient context to reduce the need for merchants to repeatedly provide transaction or account information.

26. Fraud Monitoring & Risk Alerts

Fraud Monitoring helps protect merchants and their customers by identifying potentially suspicious payment activity and providing visibility into transactions that may require attention.

The PSP should continuously monitor payment activity and apply appropriate risk controls to help detect unusual or potentially fraudulent transactions. Where merchant action is required, the portal should clearly communicate the affected transaction, its status, and the required next step.

Key capabilities:

- View transactions flagged for review
- View the risk or review status of relevant transactions
- Receive alerts for suspicious payment activity
- View the reason or risk indicator where appropriate
- Search and filter transactions requiring review
- View actions taken on a transaction
- View transactions that have been blocked, declined, or held for review
- Provide additional information where merchant input is required
- Track the resolution status of reviewed transactions
- View historical fraud-related alerts and outcomes

Fraud monitoring should operate across supported payment channels and consider transaction activity throughout the payment lifecycle.

The merchant should not be exposed to sensitive fraud detection rules, scoring logic, or internal risk thresholds. Instead, the portal should provide clear statuses and actionable information necessary for the merchant to understand and respond to relevant risk events

Recommended Merchant Portal Structure

Overview

- Dashboard

Payments

- Transactions
- Customers
- Refunds
- Disputes
- Payment Links
- Invoices

Money

- Settlements
- Wallet (wallet-enabled merchants only)
- Wallet Activity (wallet-enabled merchants only)
- Fund Management (wallet-enabled merchants only)
- Beneficiaries (wallet-enabled merchants only)
- Transfers & Disbursements (wallet-enabled merchants only)

Reports

- Analytics
- Financial Reports

Developers

- API & Integrations
- API Credentials
- Webhooks
- Sandbox

Business

- Business Profile
- Payment Methods
- Fees & Pricing
- Users & Permissions

Security

- Security Settings
- Activity & Audit History
- Fraud Monitoring and Risk Alerts
